

## Batchmaster® Integrated Systems

### Batchmaster® Box Line

One or more Batchmaster® Counters or Fast Automatic Weighers integrated to a Dual Lane Carton Indexing Conveyor. Manually erected boxes are placed on the infeed belt and are delivered to the load station where the box is sensed, stopped and filled by the counter or scale. The optional vibratory settling device ensures an even fill in the box without overflowing. The filled box is released and automatically pushed onto the outfeed belt where it awaits closing and labeling. The entire system can be run by one operator.

### Batchmaster® Clamshell Filling

One or more Batchmaster® Counters or Fast Automatic Weighers can be used to fill a wide variety of items into clamshell packages. Typical applications include hardware and fasteners such as those seen on the shelves at your local home improvement store. Drop into the clamshell is primarily random, however magnetic orientation is available for long metallic parts such as nails and screws.

The automatic process includes clamshell denesting and placement, filling, vibratory settling, closing, tamping, sealing, check weighing and one, two, three or four sided label application.
